Manufacturing Operational Insights Report

(Autonomous Retail Researcher Agent)

Course Name: Agentic AI

Institution Name: Medicaps University – Datagami Skill Based Course

Student Name(s) & Enrolment Number(s):

Sr no	Student Name	Enrolment Number
01	AKSHAT DUBEY	EN22CS100189
02	AKSHAY PRATAP SINGH	EN22CS301097
03	ADITYA TIWARI	EN22CS301071
04	ADITYA KULAKARNI	EN22CS301052
05	ABHISHEK GURJAR	EN22CS301032

Group Name: 01D1

Project Number: AAI-01

Industry Mentor Name: Nishant Shrivastava

University Mentor Name: Khaliq Ahmed

Academic Year: 4th

Problem Statement & Objectives

1. Problem Statement

In today's highly competitive retail environment, businesses need continuous market research to understand customer preferences, competitor strategies, and emerging trends. However, traditional research methods are time-consuming, manual, and often inefficient in handling large volumes of dynamic data.

Retailers struggle to:

- Collect real-time market data from multiple sources
- Analyze large datasets efficiently
- Generate meaningful insights for decision-making
- Automate repetitive research tasks

Therefore, there is a need for an intelligent, automated system that can perform end-to-end retail research with minimal human intervention.

2. Project Objectives

The main objectives of the project are:

- To design an **AI-powered autonomous agent system** for retail research
- To automate **data collection, analysis, and report generation**
- To enable **real-time insights** using web-based data sources
- To reduce manual effort and improve research efficiency
- To provide a **user-friendly interface** for interacting with the system
- To ensure scalability and modularity for future enhancements

3. Scope of the Project

The scope of this project includes:

- Automating retail market research processes
- Supporting real-time query-based research
- Generating structured and meaningful insights

- Integration with APIs for data retrieval and AI processing
- Providing a simple web interface for users

Limitations:

- Dependent on external APIs for performance and data accuracy
- Limited to available online data sources
- Requires internet connectivity for real-time functionality

Proposed Solution

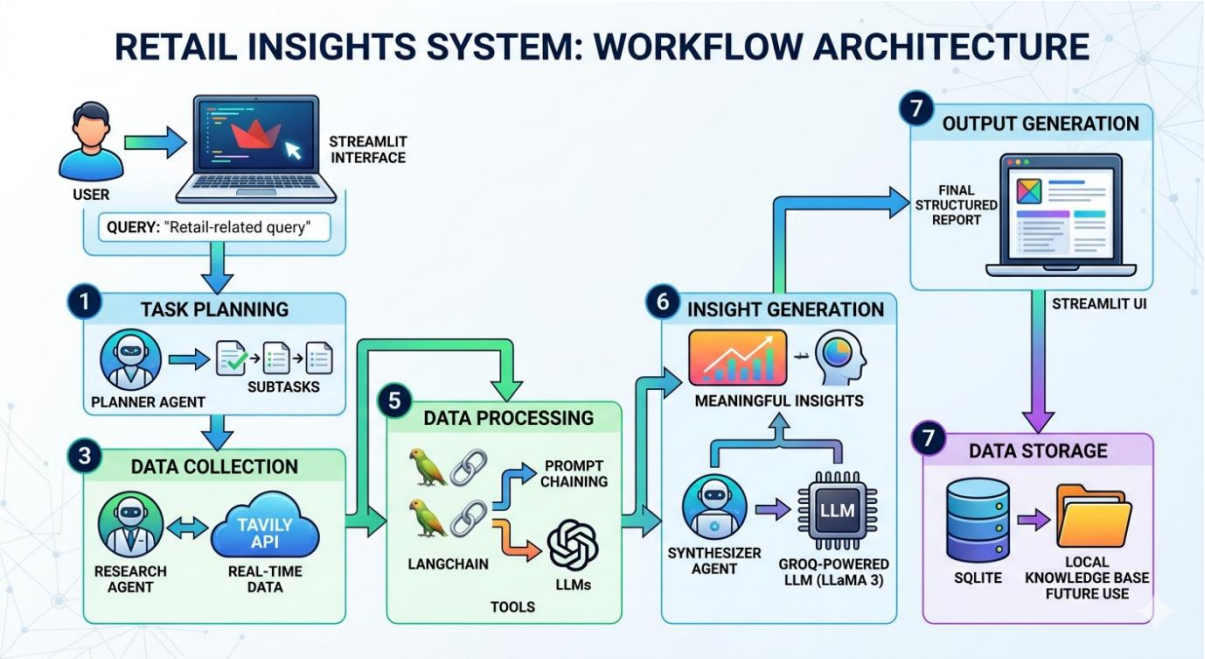
1. Key features *(Just mention key features here no need to go into details)*

   - Autonomous multi-agent system (Planner, Researcher, Synthesizer)
   - Real-time web data retrieval
   - AI-based insight generation
   - Interactive web interface using Streamlit
   - Secure API key management using .env
   - Data storage using SQLite and local repository
   - Modular and scalable architecture

2. Overall Architecture / Workflow

   The system follows a structured workflow:

   1. **User Input:**
      The user enters a retail-related query through the Streamlit interface.
   2. **Task Planning:**
      The Planner Agent analyzes the query and breaks it into subtasks.
   3. **Data Collection:**
      The Research Agent fetches real-time data using the Tavily API.
   4. **Data Processing:**
      LangChain manages prompt chaining and connects tools with LLMs.
   5. **Insight Generation:**
      The Synthesizer Agent processes collected data using Groq-powered LLM (LLaMA 3) to generate meaningful insights.
   6. **Output Generation:**
      The final structured report is displayed to the user via the Streamlit UI.
   7. **Data Storage:**
      Outputs are stored in SQLite and local knowledge base for future use.



3. Tools & Technologies Used (*If applicable)*

The development of the *Retail Autonomous Researcher Agent* involves a combination of modern programming frameworks, AI tools, and data management technologies. These tools work together to enable automation, intelligent processing, and real-time research capabilities.

Programming Language

- **Python:**
  Used as the core programming language for backend development, data processing, and integration of AI components due to its simplicity, flexibility, and strong ecosystem support.

Agent Framework

- **CrewAI:**
  Utilized to design and manage multiple autonomous agents such as Planner Agent, Research Agent, and Synthesizer Agent. It enables task orchestration, agent collaboration, and structured workflow execution.

LLM Integration & Prompt Management

- **LangChain:**
  Used for connecting Large Language Models (LLMs) with external tools,

- managing prompts, and chaining multiple operations efficiently to ensure smooth data processing and interaction.

AI Model API

- **Groq API (LLaMA 3 – 70B Model):**
  Provides high-performance Large Language Models for natural language understanding, query processing, and intelligent insight generation.

Web Data Retrieval

- **Tavily API:**
  Used to perform real-time web searches and fetch relevant information from multiple online sources for accurate and up-to-date research.

Frontend / User Interface

- **Streamlit:**
  Used to build an interactive and user-friendly web interface where users can input queries and view structured research outputs.

Database & Storage

- **SQLite:**
  Used as the database for storing task outputs (e.g., latest_kickoff_task_outputs.db) managed internally by CrewAI.
- **Local Knowledge Repository:**
  A folder-based storage system (knowledge_repo) used to store processed insights and results for future reference.

Environment & Dependency Management

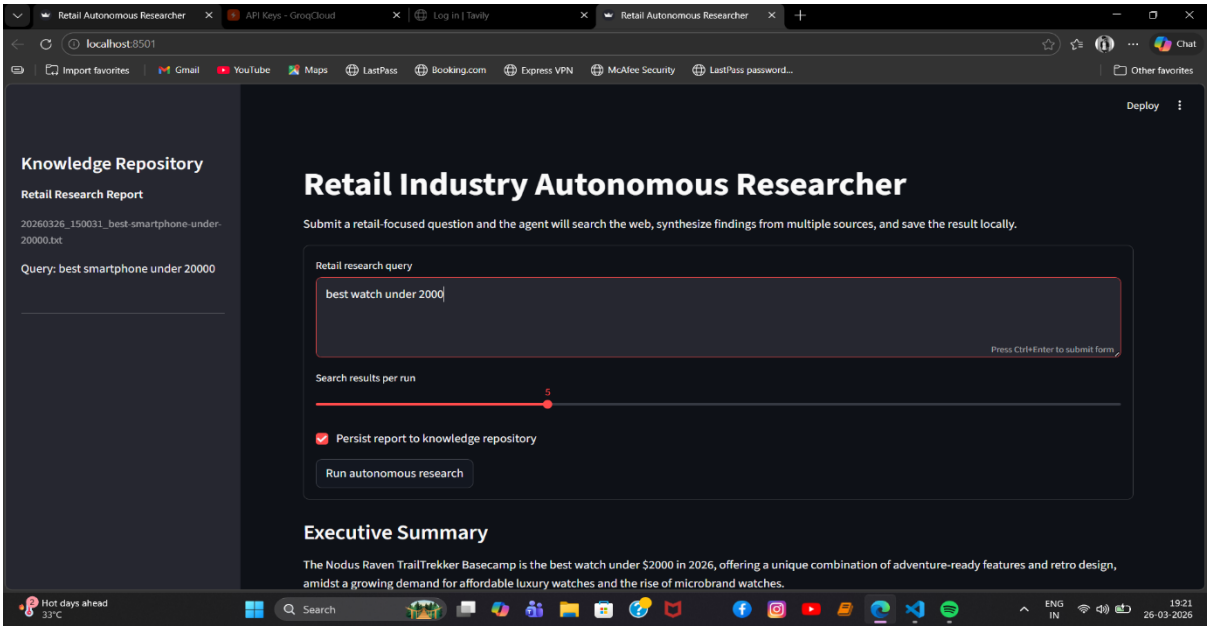
- **.env File:**
  Used to securely store API keys and environment variables (e.g., Groq API key, Tavily API key).

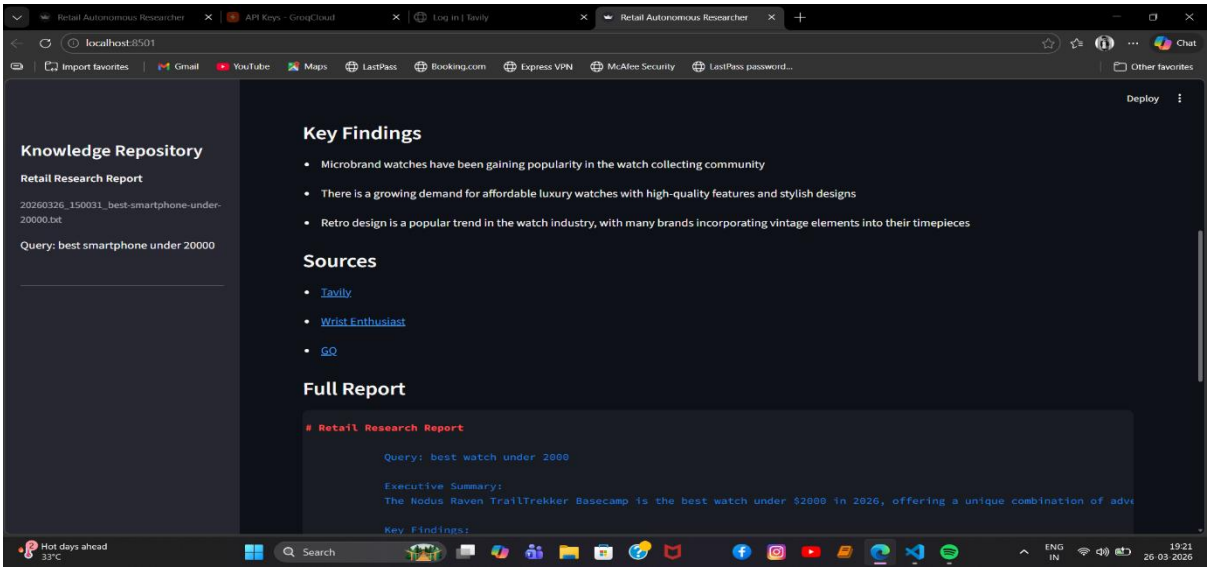
- **requirements.txt:**
  Maintains a list of all project dependencies for easy installation and setup.

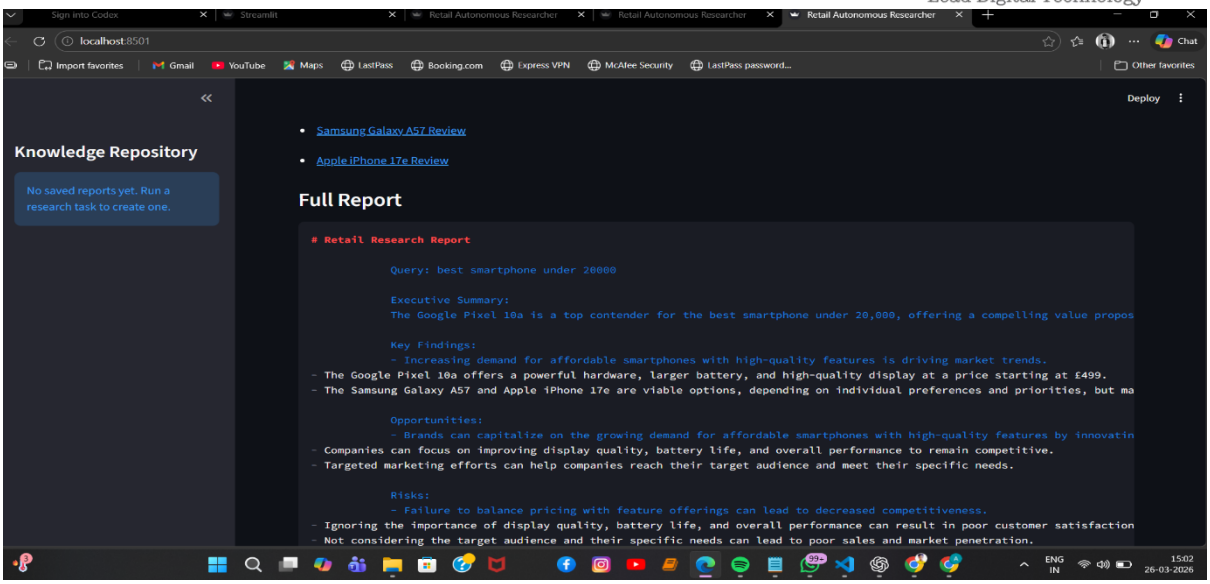
Architecture Type

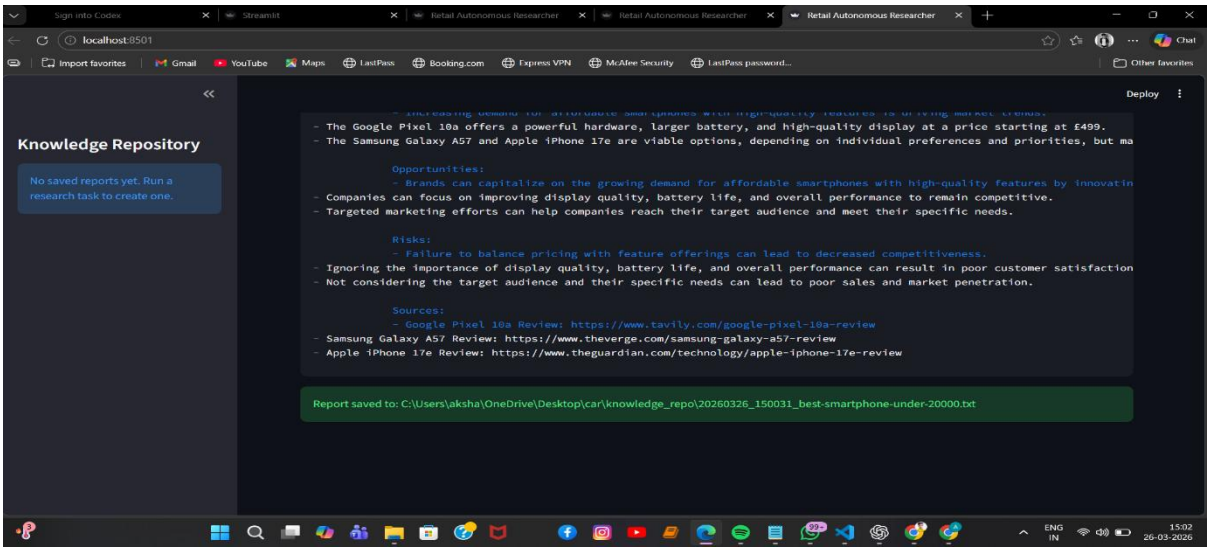
- **Modular & Scalable Architecture:**
  The system is designed with separate components for data collection, processing, analysis, and reporting, ensuring flexibility, reusability, and efficient performance.

Results & Output









1. *Reports / dashboards / models*

Generated Reports:

The system produces structured and comprehensive reports containing:

- Executive Summary
- Key Findings
- Opportunities
- Risks
- Sources

Knowledge Repository Dashboard:

Stores:

- Query history
- Generated reports
- Saved output files

 AI Model Processing:

- CrewAI agents handle planning, research, and synthesis
- Groq LLaMA 3 model generates intelligent insights
- Tavily API provides real-time data

2. *Key outcomes*

- Developed a **fully automated retail research system**
- Enabled **real-time data-driven decision-making**
- Reduced manual effort in research tasks
- Implemented **multi-agent collaboration architecture**
- Created reusable **knowledge repository system**
- Delivered **structured and professional reports**
- Built an **interactive and user-friendly interface**

Conclusion

The *Retail Autonomous Researcher Agent* successfully demonstrates the implementation of an intelligent, AI-powered system for automating retail market research. The project integrates advanced technologies such as multi-agent architecture, Large Language Models (LLMs), and real-time web data retrieval to create a robust and efficient research solution.

Through the use of CrewAI, the system effectively coordinates multiple agents (Planner, Researcher, and Synthesizer) to perform complex tasks in a structured manner. LangChain enables seamless interaction between tools and models, while the Groq API

enhances the system's ability to generate accurate and meaningful insights. The integration of the Tavily API ensures access to real-time and relevant information from the web.

The Streamlit-based user interface provides a simple and interactive platform for users to input queries and receive structured outputs. Additionally, the use of SQLite and local storage ensures efficient data management and reusability of insights.

Overall, this project highlights the potential of combining AI, automation, and modular design to solve real-world problems in the retail domain. It also provides valuable learning in areas such as agent-based systems, API integration, prompt engineering, and full-stack AI application development.

Future Scope & Enhancements

The project can be further enhanced in several ways to improve functionality and scalability:

- **Advanced Data Visualization:**
  Integrate dashboards and charts for better representation of insights.
- **Multi-Domain Expansion:**
  Extend the system beyond retail to domains like finance, healthcare, and e-commerce.
- **User Authentication System:**
  Add login/signup features for personalized user experience.
- **Cloud Deployment:**
  Deploy the system on cloud platforms (AWS, Azure, GCP) for scalability and accessibility.
- **Improved Memory & Context Handling:**
  Implement long-term memory using vector databases like Pinecone or FAISS.
- **Real-time Notifications:**
  Provide alerts for market trends and changes.
- **Voice-based Interaction:**
  Enable voice input and output using speech recognition.
- **Performance Optimization:**
  Enhance speed and reduce API dependency through caching mechanisms.
- **Customizable Agent Roles:**
  Allow users to define and configure their own agents.
